

The Inspectis Flex Acrobat is a full HD system on a flexible arm that allows the technician to move it around freely above instruments and surgical kits. The ability to control the height of the camera allows the technician to view and utilize wider work areas. The system can plug directly into a monitor for a free standing system, or connect to a computer through optional Capture Card which allows the technician to easily capture images to their database for instrument cataloging and training.

By moving the camera higher, the technician can also capture images of full surgical kits for documentation.

1.6x - 70x Magnification

Key Features:
